

Blinkit Q-Commerce

Retail Analytics

Insights Report By Khushi Vadadoriya

Sales Snapshot: High-Value Baskets Drive Business

Blinkit's dataset shows a total revenue of \$1.20M, supported by 8523 items sold.

The most striking metric is the average sale value of \$141.

Interpretation

An AOV of \$141 indicates that customers are not making small individual purchases.

Instead, they are placing high-value, multi-item baskets—treating Blinkit as a primary grocery and essentials replenishment platform rather than an emergency purchase service.

This aligns with high sales in fruits, vegetables, snacks, and household items—core components of any medium to large grocery basket.

Business Recommendations

- Introduce weekly and monthly grocery bundles.
- Provide cart-based savings (“Save \$20 on carts above \$200”).
- Expand value pack SKUs (e.g., family-size snacks, bulk perishables).
- Add auto-replenishment subscriptions for dairy, fruits, cleaning essentials.

Low-Fat vs Regular

Key Numbers

- Low-Fat Sales: \$776.32K
- Regular Sales: \$425.36K
- Low-Fat No Of Items: 6K
- Regular No Of Items: 3K
- Ratings: Almost equal (3.92 vs 3.91)

Interpretation

Low-Fat outperforms Regular by almost 2x, even though ratings remain identical.

This means:

- Customers prefer healthier product variants.
- The demand for “better-for-you” foods is real and scalable.
- Taste or satisfaction isn’t a deciding factor; customers focus on daily healthy foods.

Business Recommendations

- Expand low-fat SKUs.
- Create “Healthy Basket” bundles for recurring customers.
- Introduce app banners focused on health categories.
- Partner with niche health brands for exclusive offerings.

Tier-Based Performance: Tier 3 Outperforms Tier 1

Revenue by Location Type

- Tier 3: \$472.13K
- Tier 2: \$393.15K
- Tier 1: \$336.14K

Interpretation

Tier 3's dominance is significant.

It contradicts the typical e-commerce assumption that Tier 1 drives the highest orders.

Reasons for this pattern:

- Fewer offline retail options → stronger dependency on quick commerce.
- Customers in smaller cities value convenience even more.
- Higher frequency of household essentials purchases.

Business Recommendations

- Increase dark-store density in Tier 3 clusters.
- Strengthen inventory for essentials: fruits, snacks, dairy.
- Add regional product variants to connect with local demand.
- Run hyperlocal campaigns in Tier 3 to increase retention.

Category Leaders: What Consumers Buy the Most

Top Revenue-Generating Categories

1. Fruits & Vegetables - \$0.18M
2. Snacks - \$0.18M
3. Household - \$0.14M
4. Frozen Foods - \$0.12M
5. Dairy - \$0.10M

Interpretation

The leading categories are high-frequency essentials.

These items refill weekly or monthly, explaining the high AOV and high item count.

Business Recommendations

- Launch “Smart Refill” bundles combining top 3 categories.
- Add AI-powered recommendations for basket expansion (milk + bread, detergent + softener).
- Push seasonal produce promotions to increase fruits/vegetables uptake.

Outlet Establishment Year

Performance by Year

- 1998 outlet: \$205K (highest)
- 2011 outlet: \$78K (lowest)
- 2020: Slight dip (\$129K)

Interpretation

Outlet age does not correlate with performance.

Instead, success is driven by:

- City tier
- Outlet type
- Stocking efficiency
- Local demand patterns

Business Recommendations

- Focus on location analytics, not outlet age.
- Use outlet age only for maintenance and cost management, not forecasting.

Outlet Size: Medium Stores Leads in Revenue

Revenue by Size

- Medium: \$507.90K
- Small: \$444.79K
- High: \$248.99K (lowest)

Interpretation

Medium outlets strike the perfect balance:

- Enough variety
- Efficient stocking
- Lower operational overhead

High-size outlets underperform because:

- Extra inventory doesn't convert
- Costs are disproportionately higher
- Customer base may not require a large SKU range in that locality

Business Recommendations

- Standardize the medium-size store blueprint as the default.
- Convert underperforming large outlets into multiple micro-outlets.
- Restrict large stores to dense Tier 1 metro clusters.

Outlet Type: Supermarket Type 1 Leads

Key Findings

- Supermarket Type 1 generates the highest total revenue.
- But it has the lowest item visibility (0.06).
- Grocery stores have the highest visibility (0.10) but significantly lower revenue.

Interpretation

Supermarket Type 1 stores perform well because they are:

- Located in high-demand zones
- Stocked with fast-moving products
- Optimized for conversions, not visibility

Grocery stores generate less revenue despite higher visibility because:

- Their product mix is narrower
- Their pricing and variety are more limited
- They rely on impulse purchases

Business Recommendations

- Improve digital visibility for Supermarket Type 1 stores (banners, top results).
- Strengthen grocery stores with bundle-based discounts and popular household SKUs.
- Perform visibility-to-conversion analysis to increase efficiency.

Executive Summary

This analysis of Blinkit's retail data reveals \$1.20M in total sales driven by unusually high \$141 average order values, showing that customers place large, multi-item grocery baskets rather than small convenience orders. Low-fat products outperform regular items nearly 2:1, highlighting strong preference for healthier options across regions. Surprisingly, Tier 3 outlets generate the highest revenue, indicating rapid Q-Commerce adoption in smaller cities with limited offline retail competition. Essential categories—fruits & vegetables, snacks, household goods, and dairy—are the main revenue drivers, reflecting weekly and monthly replenishment behavior. Operationally, medium-sized outlets show the strongest performance, and Supermarket Type 1 stores convert well despite low visibility. These insights point toward strategic opportunities in bundle creation, subscriptions, Tier 3 expansion, and SKU optimization.
